

Workshop on laboratory facilities for cloud research
Sep 22-24, 2021

Model intercomparison study of aerosol-cloud-turbulence Interactions in the Pi Chamber

Sisi Chen (NCAR, USA) and Steve Krueger (University of Utah, USA)

Case participants: Piotr Dziekan (University of Warsaw, Poland)

Silvio Schmalfuß (TROPOS, Germany)

Shin-ichiro Shima (University of Hyogo, Japan)

Fan Yang (Brookhaven National Laboratory, USA)

Theodore MacMillan and David Richter (University of Notre Dame, USA)

Acknowledgement: Raymond A. Shaw, Will Cantrell, Prasanth Prabhakaran, Subin Thomas (Pi Chamber Laboratory, Michigan Technological University, USA)

Purpose of this presentation

- Summary and future work of the model intercomparison study
- How laboratory facility could help improve cloud physics modeling
- How modeling can also provide insights for designing future cloud-aerosol laboratory facilities and new laboratory experiments.

International Cloud Modeling Workshop, Jul 2021

Pi Chamber Inter-comparison mini workshop in Nov 2020

Motivation

- Cloud-aerosol-turbulence interactions in fine-scales are not well-understood.
- Cloud chamber measurements are valuable for comparing to simulations given the chamber's well-characterized boundary conditions, controlled environment, detailed microphysical & thermodynamic properties, etc.
- High-resolution models provide detailed information that is challenging to obtain by measurements.
- In the long run, comparing the results of high-resolution models to laboratory measurements helps to verify physics in the model. And the well-validated models in return can be used to better understand the details of physical processes that are challenging to measure with existing instruments.

Pi Chamber

FIG. 1. A cutaway schematic of the cloud chamber with one door open and the cylindrical thermal panel in place.

Model intercomparison case

Interior snapshot of the Pi Chamber

Steady-state case in the Pi Chamber

- Steady aerosol injection (prescribed injection rates)
- Thermostatic wall conditions (fixed wall temperature and near wall humidity)
- Steady-state droplet size distribution
- Steady-state thermal and turbulent environment

Steady-state case in the Pi Chamber

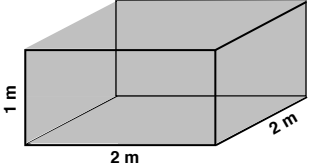

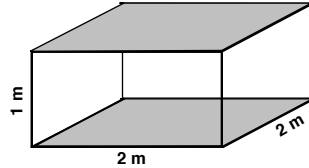

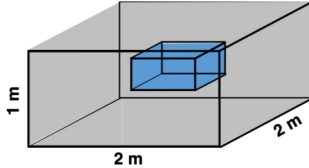

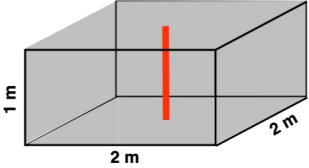

- **Temperature is controlled at all walls** (bottom, top, and sides).
- **Turbulence** is generated by the vertical temperature gradient.
- **Supersaturation is produced** by mixing of air saturated at T_{bot} and T_{top}
- **Constant aerosol injections.**
- **Droplets grow and fall out.**

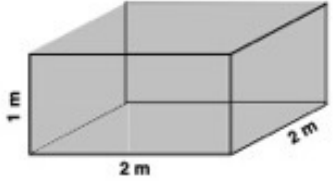

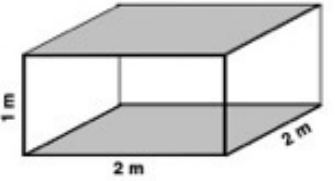

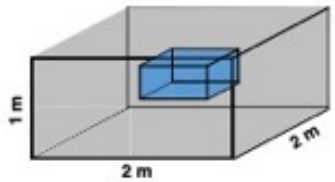

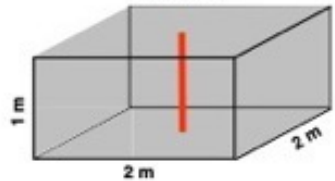

Steady-state case in the Pi Chamber

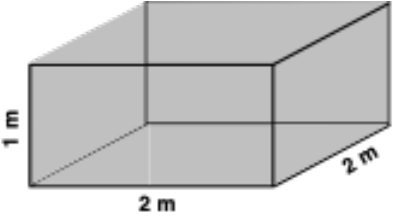

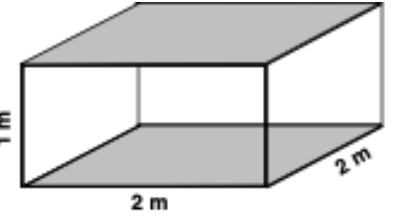

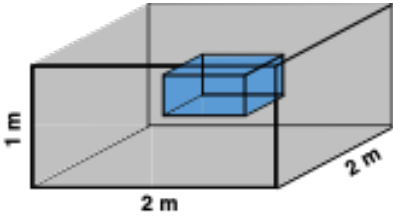

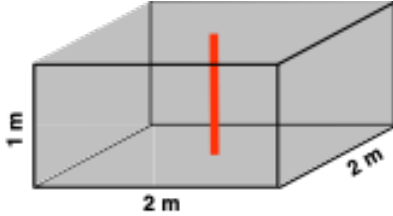

- **Temperature is controlled at all walls** (bottom, top, and sides).
- **Turbulence** is generated by the vertical temperature gradient.
- **Supersaturation is produced** by mixing of air saturated at T_{bot} and T_{top}
- **Constant aerosol injections.**
- **Droplets grow and fall out.**

Participating modelers

Model Type	Participants	Model Name	Simulated Chamber Geometry
LES	Piotr Dziekan (University of Warsaw)	UWLCM	
	Shin-ichiro Shima (University of Hyogo)	SCALE-SDM	
	Silvio Schmalfuß (Leibniz Institute for Tropospheric Research)	TROPOS-LES	
	Fan Yang (Brookhaven National Laboratory)	SAM	
DNS	Theodore MacMillan/ David Richter (University of Notre Dame)	DNS	
	Sisi Chen (NCAR)	DNS	
1D-LEM	Steve Krueger (University of Utah)	EMPM (1D)	

Model Type	Participating institute	Model Name	Simulated Chamber Geometry/region
Large-eddy simulation (LES)	University of Warsaw, Poland	UWLCM	The entire chamber with top, bottom, and side walls 
	University of Hyogo, Japan	SCALE-SDM	
	Leibniz Institute for Tropospheric Research, Germany	TROPOS-LES	
	Brookhaven National Laboratory, USA	System for Atmospheric Modeling (SAM)	
Direct numerical simulation (DNS)	University of Notre Dame, USA	UND-DNS	The entire chamber without side walls 
	National Center for Atmospheric Research, USA	NCAR-DNS	The core region of the chamber 
1D Linear-eddy model (1D-LEM)	University of Utah, USA	EMPM	One-dimensional vertical column of the chamber 

Model Type	Participating institute	Model Name	Simulated Chamber Geometry/region	Aerosol injection rates ($cm^{-3} min^{-1}$)	dx, dy, dz (cm)	Microphysics scheme
Large-eddy simulation (LES)	University of Warsaw, Poland	UW-LCM	The entire chamber with top, bottom, and side walls 	6-600	3.125	super-droplet method (SDM)
	University of Hyogo, Japan	SCALE-SDM		1-1500	6.25	SDM
	Leibniz Institute for Tropospheric Research, Germany	TROPOS-LES		1-1500	3.125	SDM
	Brookhaven National Laboratory, USA	System for Atmospheric Modeling (SAM)		15-4500	3.125	two bin schemes (Chen & Lamb; HUJI)
Direct numerical simulation (DNS)	University of Notre Dame, USA	UND-DNS	The entire chamber without side walls 	15-1500	dx, dy = 1.5625; dz = 0.78125	SDM and particle-by-particle method
	National Center for Atmospheric Research, USA	NCAR-DNS	The core region of the chamber 	50-5000	0.15625	SDM and particle-by-particle method
1D Linear-eddy model (1D-LEM)	University of Utah, USA	EMPM	One-dimensional vertical column of the chamber 	10-320	1	particle-by-particle method

Droplets' Lagrangian history

r^2 of an individual droplet along its trajectory,
and the supersaturation at droplet's location

When the supersaturation is fluctuating, a particle may grow and shrink many times before falling out.

DSDs responding to aerosol injections (NCAR DNS)

$$N_{inj} = 50 \text{ cm}^{-3} \text{ min}^{-1}$$

Pi chamber measurements
Prabhakaran et al. (2020 PNAS)

Fluctuation-influenced regime

$$N_{inj} = 5000 \text{ cm}^{-3} \text{ min}^{-1}$$

Fluctuation-dominated regime

Different models occupy different regions of $\langle s \rangle$ - $\langle s's' \rangle$ space

Mean radius depends on both $\langle s \rangle$ and $\langle s's' \rangle$

Different models occupy different regions of mean supersaturation $\langle s \rangle$ and fluctuations $\langle s's' \rangle$ space

The mean radius depends on both $\langle s \rangle$ and $\langle s's' \rangle$

Summary

UND-DNS

NCAR-DNS

TROPOS-LES

SAM-LES

SCALE-SDM

EMPM

- First inter-comparison study on cloud chamber simulations
- A diverse set of model geometries
- Various microphysics schemes
- Each model inhabits different regions of $\langle s \rangle$ - $\langle s's' \rangle$ space.
- Both of $\langle s \rangle$ and $\langle s's' \rangle$ are important for determining the DSD, and neither dominates.
- The processes that determine LWC, DSD shapes, Nd, etc. in the Pi Chamber remain poorly quantified in simulations and measurements.
- The model results exhibit numerous differences that are not yet well understood.

Future work

- Further analyze the simulated wall fluxes and the particle settling timescales
- Investigate the role of large-scale circulations inside the chamber
- Perform Lagrangian microphysics analysis
- Obtain more measurements from Pi Chamber to evaluate the model results
- Perform model-observation comparisons
